The Migration Factory

Scaling Virtualisation

Red Hat

Virtualization Migration Assessment (VMA)

Plan to quickly and safely migrate.

Capture current VM architecture, analyze workload complexity, and propose a high-level roadmap.

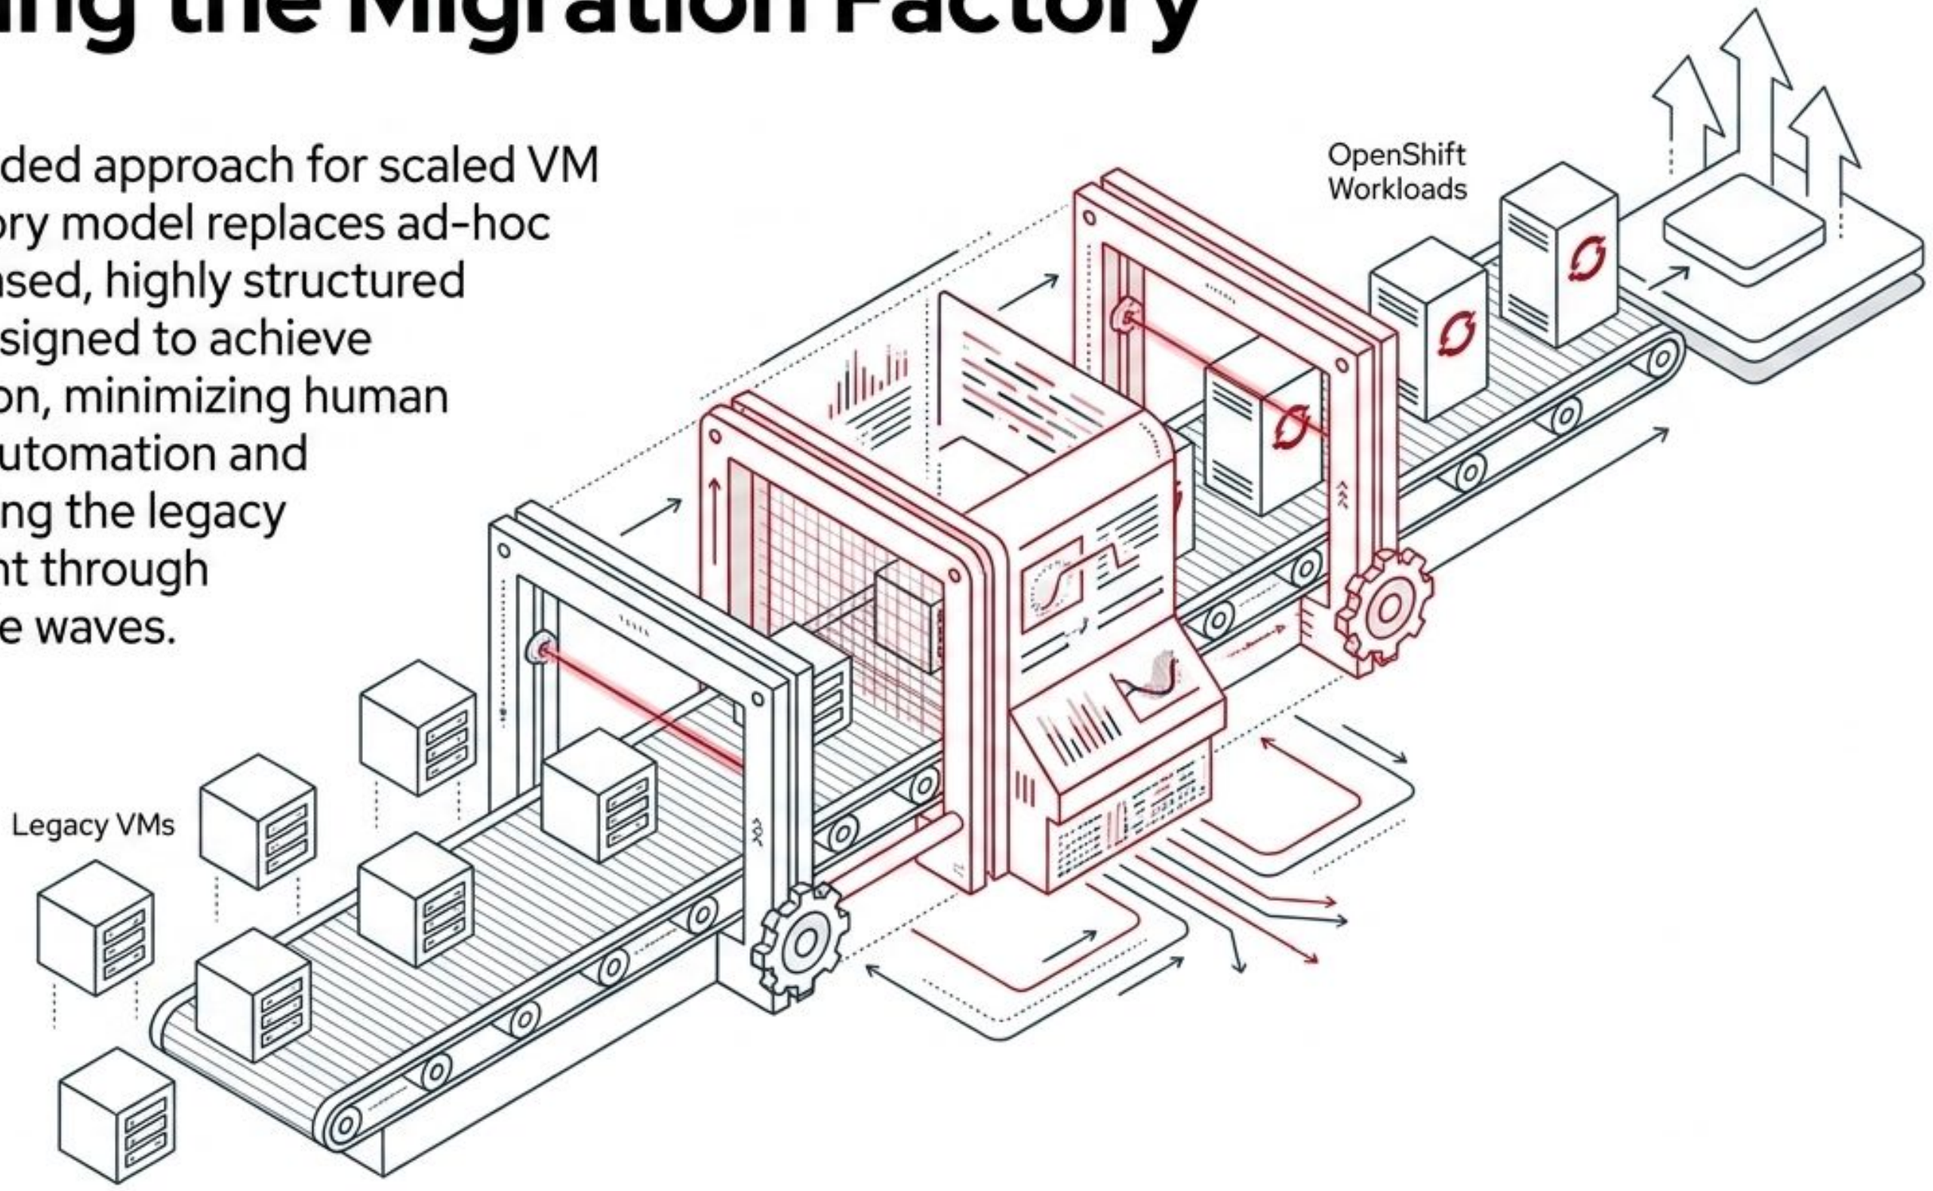
Virtualization Migration Factory (VMF)

Deploy technology and operate at scale.

Deploy OpenShift, validate integrations, and execute steady-state migration to systematically reduce the legacy footprint.

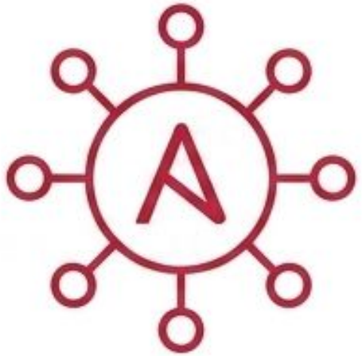
Engineering the Migration Factory

Red Hat's recommended approach for scaled VM migrations. The factory model replaces ad-hoc transitions with a phased, highly structured methodology. It is designed to achieve steady-state migration, minimizing human error through strict automation and systematically reducing the legacy virtualization footprint through repetitive, predictable waves.



The Automation Engine: Ansible for OpenShift Virtualization

A robust content collection seamlessly integrated with AAP, utilized by trained consultants to orchestrate complex migrations.



Drive Adoption

Scale OpenShift Virtualization by automating assessment, execution, and Day-2 operations.

Enable Administration

Allow VMware admins to move workloads using graphical interfaces and automation, eliminating the immediate need for deep CLI or Kubernetes expertise.

Provide Prescriptive Methodology

Migrate configurations from the entire VMWare stack reliably and repeatably.

Automating the Critical Path

Pane 1: Pre-Configuration & Discovery

- Pulls inventory directly from vCenter.

- Automates hardware discovery and creates reusable configuration facts.

Pane 2: Migration Tasks

- Automates the creation of MTV (Migration Toolkit for Virtualization) primitives, including NetworkMaps and StorageMaps.
- Generates advanced batch migration plans to accelerate the movement of hundreds of VMs.

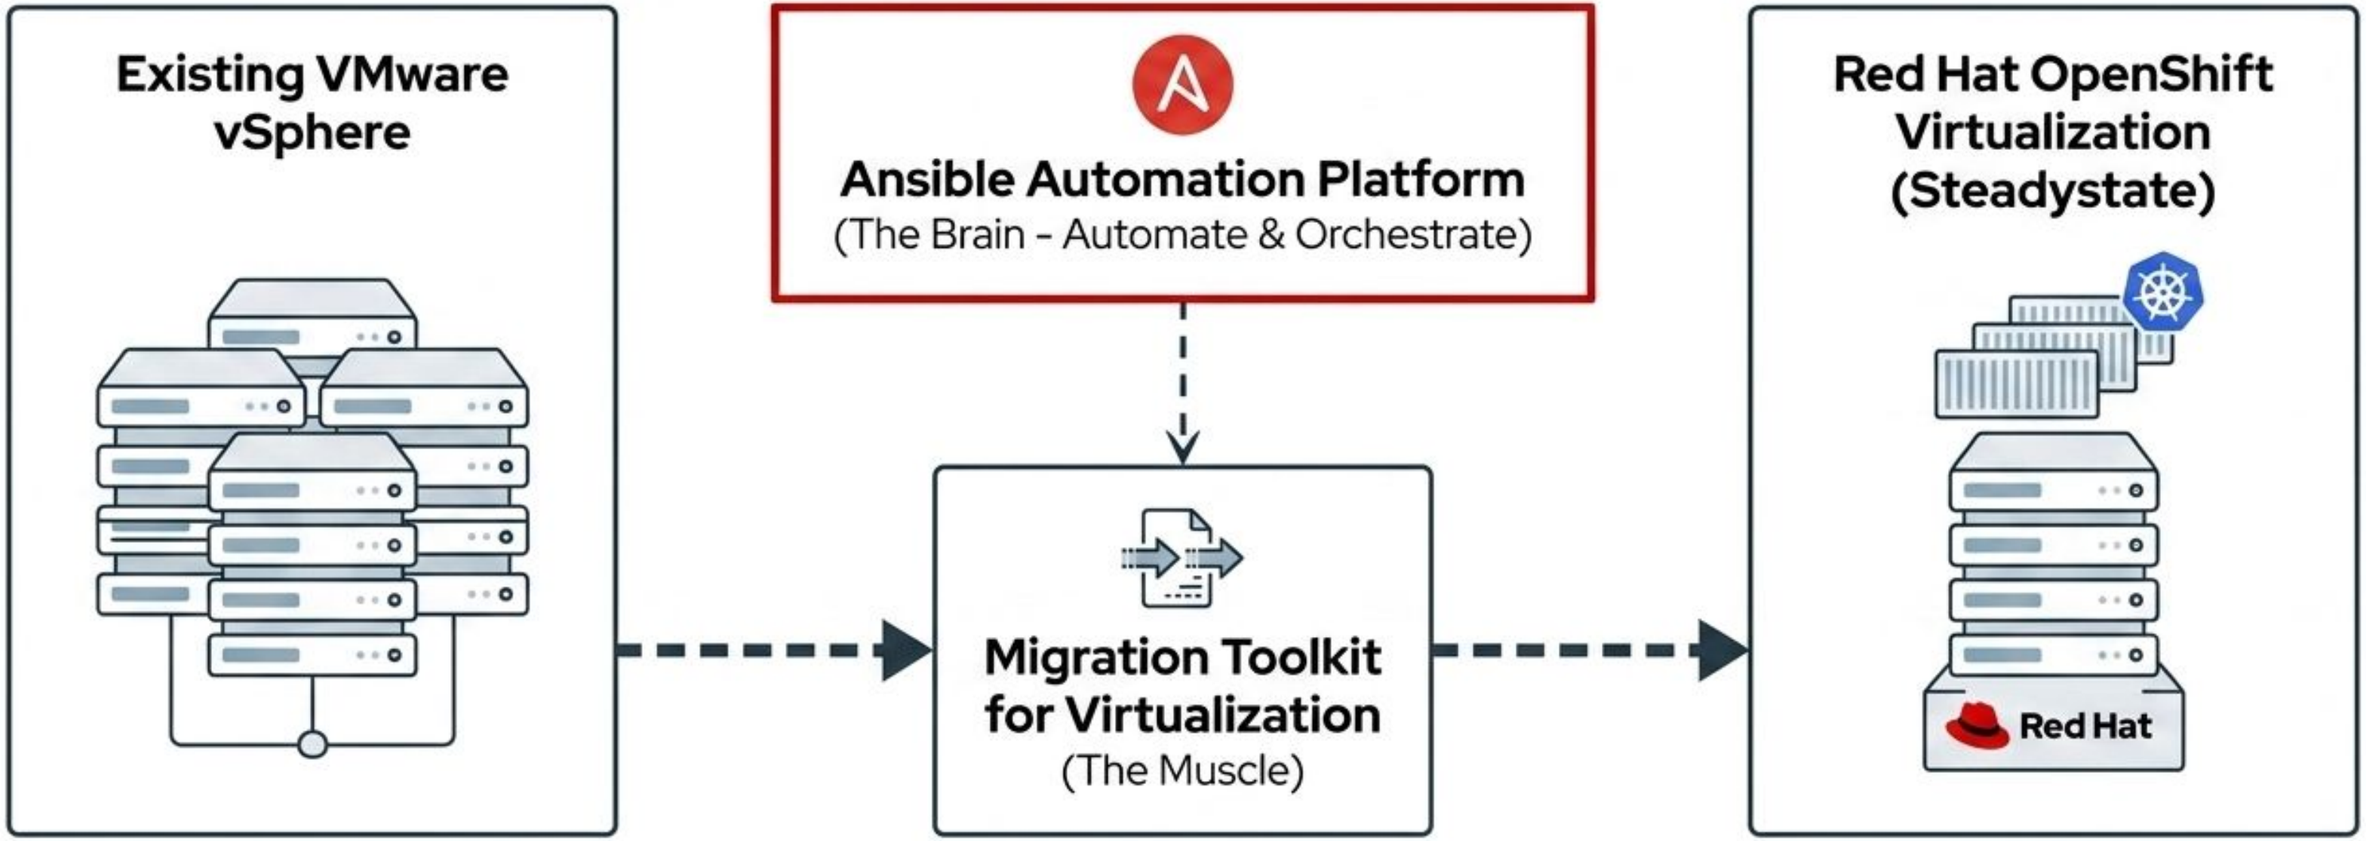
Pane 3: Day-2 Operations

- Manages ongoing VM lifecycle, post-migration configuration, patching, and backups.

- Automates critical post-migration tasks, such as injecting VirtIO drivers for Windows VMs.

The Architecture of Scale

Ansible acts as the central orchestration brain, driving the Migration Toolkit for Virtualization to create a reliable, repeatable pipeline from source to destination.



Thank you
